Practical Lab 2

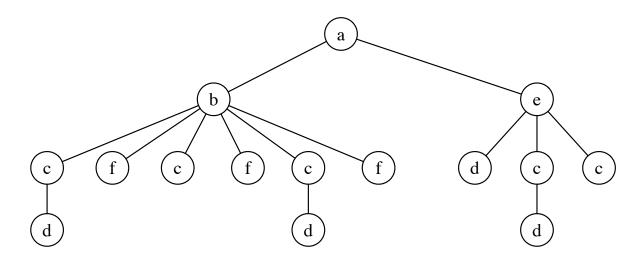

Web Data Models

October 1st, 2018

The goal of this lab session is to understand XML validation, both for DTD and XML, and to evaluate the differences between the two schema languages.

1 DTD Validation

Consider the following XML document t, given in tree form:

- 1. Provide a DTD D such that the document t is valid with regard to D. Validate it using the command $\mathtt{xmllint}$.
- 2. Write D as a regular grammar G.
- 3. Show that t is in L(G). Hint: explain how a unranked tree automaton works on t and G.
- 4. Generate another non-trivial document that is in L(G) (i.e., it should contain a few elements). Again, validate it using xmllint.

2 DTD and RTG

Consider the following DTD D:

```
<!ELEMENT files (file*, person*) >
<!ELEMENT file (consultation)* >
<!ELEMENT consultation (symptom+, prescription?) >
<!ELEMENT symptom (#PCDATA) >
<!ELEMENT prescription (medication)* >
<!ELEMENT medication (#PCDATA) >
<!ELEMENT person (fname, lname, telnum?) >
<!ELEMENT fname (#PCDATA) >
<!ELEMENT lname (#PCDATA) >
<!ELEMENT telnum (#PCDATA) >
```

Moreover, consider the following regular tree grammar G:

```
Files 
ightarrow files[File*, Patient*, Doctor*] \ File 
ightarrow file[Consultation*] \ Patient 
ightarrow person[FName, LName] \ Doctor 
ightarrow person[FName, LName, Tel] \ Consultation 
ightarrow consultation[Symptom+, Prescription?] \ Prescription 
ightarrow prescription[Medication*] \ FName 
ightarrow fname[Pcdata] \ LName 
ightarrow lname[Pcdata] \ Tel 
ightarrow telnum[Pcdata] \ Symptom 
ightarrow symptom[Pcdata] \ Medication 
ightarrow medication[Pcdata]
```

- 1. Can every document that is valid w.r.t. the DTD D be generated by the RTG G? Justify why or give a counter-example if applicable.
- 2. Is every document generated by G valid w.r.t. the DTD D? Justify why or give an counter-example if applicable.
- 3. Can G be expressed as a DTD? If so, write the DTD down.
- 4. Can G be expressed as XML Schema? If so, write down the resulting XML schema.

3 XML Schema

Consider the XML schema specified by:

```
<xs:sequence>
        <xs:element name="orderperson" type="xs:string"/>
        <xs:element name="shipto">
          <xs:complexType> <xs:sequence>
            <xs:element name="name" type="xs:string"/>
            <xs:element name="address" type="xs:string"/>
            <xs:element name="city" type="xs:string"/>
            <xs:element name="country" type="xs:string"/>
          </xs:sequence> </xs:complexType>
        </xs:element>
        <xs:element name="item" maxOccurs="unbounded">
          <xs:complexType> <xs:sequence>
            <xs:element name="title" type="xs:string"/>
            <xs:element name="note" type="xs:string" min0ccurs="0"/>
            <xs:element name="quantity" type="xs:positiveInteger"/>
            <xs:element name="price" type="xs:decimal"/>
          </rs:sequence></xs:complexType>
        </xs:element>
       </xs:sequence>
      <xs:attribute name="orderid" type="xs:string" use="required"/>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

Give a corresponding regular tree grammar, a non-trivial document valid w.r.t. the above schema, and validate using xmllint:

```
xmllint -noout -schema <xsd_file> <xml_file>
```

4 Properties of Regular Tree Grammars

Consider the following two regular tree grammars:

```
G_{1} \hspace{1cm} G_{2} \\ \hline \hspace{1cm} Dir \rightarrow directory[Pers+] \\ Pers \rightarrow student[StudContact] \\ Pers \rightarrow teacher[TeachContact] \\ StudContact \rightarrow contact[NameNumAdr?] \\ TeachContact \rightarrow contact[NameAdrTel?] \\ Name \rightarrow name[PCdata] \\ Num \rightarrow num[PCdata] \\ Adr \rightarrow address[PCdata] \\ Tel \rightarrow telnum[PCdata] \\ \hline Tel \rightarrow telnum[PCdata] \\ \hline \\ G_{2} \\ Dir \rightarrow directory[Pers+] \\ Pers \rightarrow student[PerContact] \\ Pers \rightarrow teacher[PerContact] \\ PerContact \rightarrow contact[NameAdr?] \\ Name \rightarrow name[PCdata] \\ Adr \rightarrow address[PCdata] \\ Adr \rightarrow address[PCdata]
```

- 1. Is every document generated by G_2 also generated by G_1 , i.e., $L(G_2) \subseteq L(G_1)$?
- 2. Is there a DTD equivalent to G_1 and/or G_2 ? If possible, provide the DTD(s).
- 3. Give an XML document generated by both regular tree grammars.

5 (Optional) Properties of Regular Tree Grammars

Consider two regular tree grammars $G_1 = (N_1, T, S_1, P_1)$ and $G_2 = (N_2, T, S_2, P_2)$, having the same terminal symbols T. Can you build the regular tree grammar $G_3 = (N_3, T, S_3, P_3)$ that captures the intersection of $L(G_1)$ and $L(G_2)$?
